Recommendation: As per advisor A the growth funds yields higher funds return, but the simulation tells that strategy carries a high risk due to the standard dev of 4.37%. Since Alex is looking for safe emergency fund this is not suitable. Cummulative distribution shoes that by investing 100% in stability find can reach certain 25,000 goal. Hence, it is better to go with advisor B strategy of investing in stability funds rather than growth funds.
