STOCK MARKET INVESTMENT FANTASY LEAGUE

By:
18BCE0945 Shweta Mittal
18BCE2138 Aditi Chowdhuri
18BCE2158 Yash Dungarwal

Under the guidance of:
Dr Sweta Bhattacharya

Course Name: Software Engineering (EPJ)
Course Code: CSE3001
Class Number: VL2019205001660 & VL2019205005678
Slot: L21+L22 & L51+L52
Semester: WINTER 2019-2020

COMP1:Project Objective:

The stock market, play a pivotal role in the economy today. Both are signals of the strength of the private sector and consumer confidence. It is thus no surprise that more and more people want to be involved in these markets and attempt to increase their own wealth.
There is however a barrier to entry for many people, both young and old in participating. That
is why with Stock Investments League we are interested in a platform for interacting with
these markets and providing educational interfaces for breaking down these barriers. Users should
be able to easily register with the system and begin participating immediately. They should be
given an imaginary cash portfolio where they can perform basic market orders such as buy and sell.
These orders to should mimic real market orders as closely as possible and should include a brokers fee. More sophisticated market maneuvers should be unlocked as the user progresses through an achievements ladder. These achievements can award users with new abilities or additional cash to their portfolio as they rise up the achievements ladder.

Leagues exist to allow multiple users to compete against a subset of the global user base with individual league rules. This allows leagues to set particular goals in order to be declared the winner.
Leagues will require a cash buy-in that will be pooled together and distributed to the winner(s) as
seen fit by the league creator. To help facilitate these leagues, a leader board will be created for
each individual league such that users can see their progress. In addition to league leader boards,
Multiple global leader-boards will be available providing specific metrics of comparison.

To help facilitate a better understanding of markets, market metrics should be available to
the user through news feeds of companies in their portfolio, interactive charts, and a live ticker of
current trades happening on our platform. Users should be able to have granular control of email
and social media updates.
The entire experience combined with the above features provide an enthralling core experience for users to learn about the stock market.

COMP2: Process model chosen with justification:

Software process models often represent a networked sequence of activities, objects, transformations, and events that embody strategies for accomplishing software evolution.Each model represents a process from a specific perspective.

Such models can be used to develop more precise and formalized descriptions of software life cycle activities.A software process model is a simplified representation of a software process.

For this project, we intend to use the Waterfall Model.

The waterfall model is a sequential approach, where each fundamental activity of a process represented as a separate phase, arranged in linear order.In the waterfall model, you must plan and schedule all of the activities before starting working on them (plan-driven process).

As for this stock investment project, we already know all the requirements for each step, waterfall model is the best fit model for us.Some of the advantages of the model for us are:

- Easy to explain to the project members.
- Structured approach.
- Stages and activities are well defined.
- Helps to plan and schedule the project.
- Verification at each stage ensures early detection of errors/misunderstanding.
- Each phase has specific deliverables.

In principle, the waterfall model should only be applied when requirements are well understood and unlikely to change radically during development

COMP3:Stakeholders, Project and Product Scope:

Stakeholders

In general, a stakeholder is someone in an organization or group that is affects or is affected by the decision made by that particular organization or group. For the Stock Investment League, any user (investor) in a league will be considered a primary stakeholder because any transaction made within their league, will influence other users investors.
The target demographic for the software described tends to be centered on students and first time investors, as a result, it is unlikely that novice investors will participate in real trade without any experience. That being said, it is likely to see the software expand to take a large role in both university and pre-university classrooms, as a means of teaching general financial concepts.
The software is targeted not only at students and potential investors,
but at nearly everyone who desires to gain a greater understanding of the financial industry as well as those who would simply like to practice trading before executing in the real market.

Investor

A user who has an account in our servers and is logged in to their account. These will be regarded as our **primary stakeholders.**
– Research the latest updates in the market – View their portfolio – Execute orders of any kind – Join/create a league – Take part in competitions

Guest

A visitor to the website who has either not logged in or just a simple visitor. Visitors will be regarded as **secondary stakeholders.**– Register and create an account– View the latest trades

Owners: people who legally have the right to possess the web application. Owners' goals is contributing the software to multiple universities across the world, keep low cost maintenance and customer satisfaction.

Managers: person who is in charge of affairs, , resources and expenditures of the web application. They interests include performance, growth, customer satisfaction, profit, cost, employees, and demand.

Employees: person who is in charge of maintaining the web application, they will provide support to system administrators (university professors) , they will perform software updates to minimize troubleshooting. Their interests are reliability, working conditions, salary, working hours, job security, and benefits.

Customers (Universities, students and professors): A person who is registered in the web application and creates his own stock portfolio, a system administrator (professor) can register without having stock portfolio and universities that will host the web application on their web page. . The customer's interests include software value, quality, reliability and service.

Advertisers: An academic institute who calls the attention of the students to participate in daily activities. Finance companies who want to address students. Advertiser's interests are number of customers, detecting leading players.

Stock Researcher: An individual who researches the human behavior in the field of investment in stocks. His or her interests include investors, human behavior, and

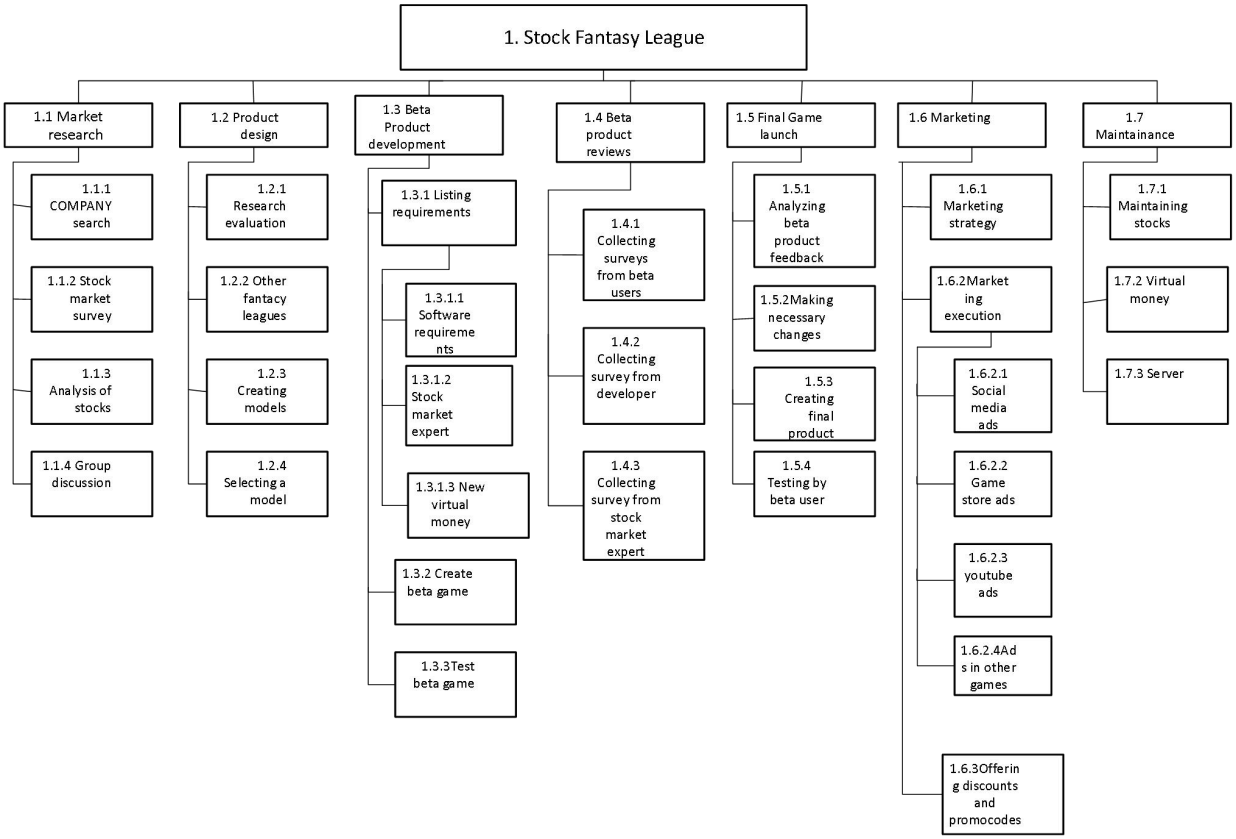

Project Scope-
The concept of a stock market game has come about, in which contestants are given a set amount of fictional money to "invest" in real stocks. At the end of the game, the participant with the most money wins. While disguised as a game, this activity provides students of finance an opportunity to make use of concepts learned in class and hone their abilities. The financial industry has changed considerably in recent times. While a trader a mere 20 years ago would rely on television, newspapers and telephones to gather market information traders today have the entire internet at their disposal.

Product Scope -
For every user

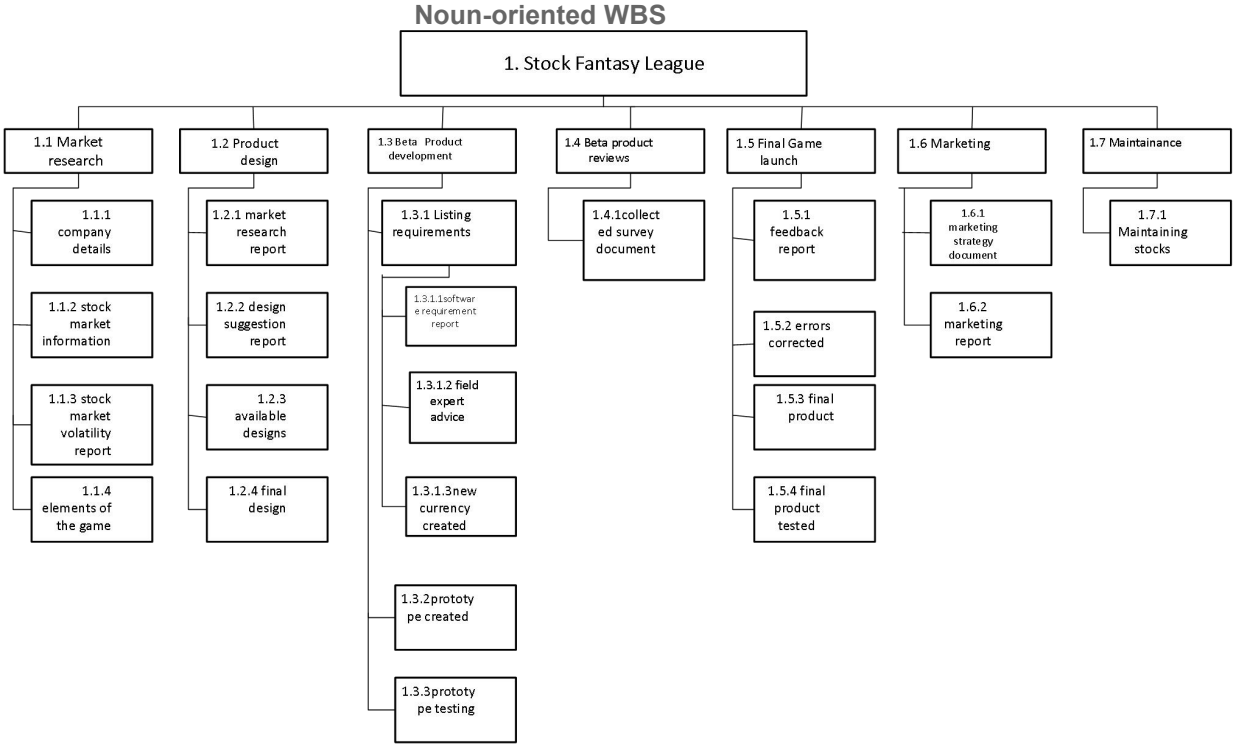

- o Pre-login info page
- o Login
- o Registration
- o Account management
  - o Change password
  - o Change contact information
- o For the system administrator
  - o Add or remove professors as league administrators
  - o View system usage statistics
  - o Manually reset user passwords
- o For the League administrators
  - o Start, manage and end a league
  - o Set league rules and policies
  - o Manually add or remove players
  - o View league statistics
- o For the Player
  - o View their portfolio
  - o View competitor portfolios through a profile page
  - o Initiate market orders
  - o View stock price history of any public company
  - o view leaderboard and other league statistics
  - o Communicate with league administrator
